| Specificity/Sensitivity     | This antibody recognizes a carbohydrate epitope on a single chain,<br>transmembrane, heavily glycosylated protein of 90-120kDa, which is identified as<br>CD34 (VI international workshop on human differentiation antigens). Its<br>expression is a hallmark for identifying pluripotent hematopoietic stem or<br>progenitor cells. Its expression is gradually lost as lineage committed progenitors<br>differentiate. CD34 is a marker of choice for staining blasts in acute myeloid<br>leukemia. In addition, it is expressed by soft tissue tumors, such as solitary<br>fibrous tumor and gastrointestinal stromal tumor. CD34 expression is also found<br>in vascular endothelium. Additionally, proliferating endothelial cells overexpress<br>this molecule than the non-proliferating endothelial cells. Anti-CD34 labels 85%<br>of angiosarcoma and Kaposi s sarcoma, but shows low specificity. |
| Immunogen                   | Recombinant full-length human CD34 protein (Uniprot: P28906)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
